

Global CO₂ Emissions Analysis (1986–2011)

Objective

Identify the main contributors to global CO₂ emissions and analyse how emission trends evolved over the last 25 years.

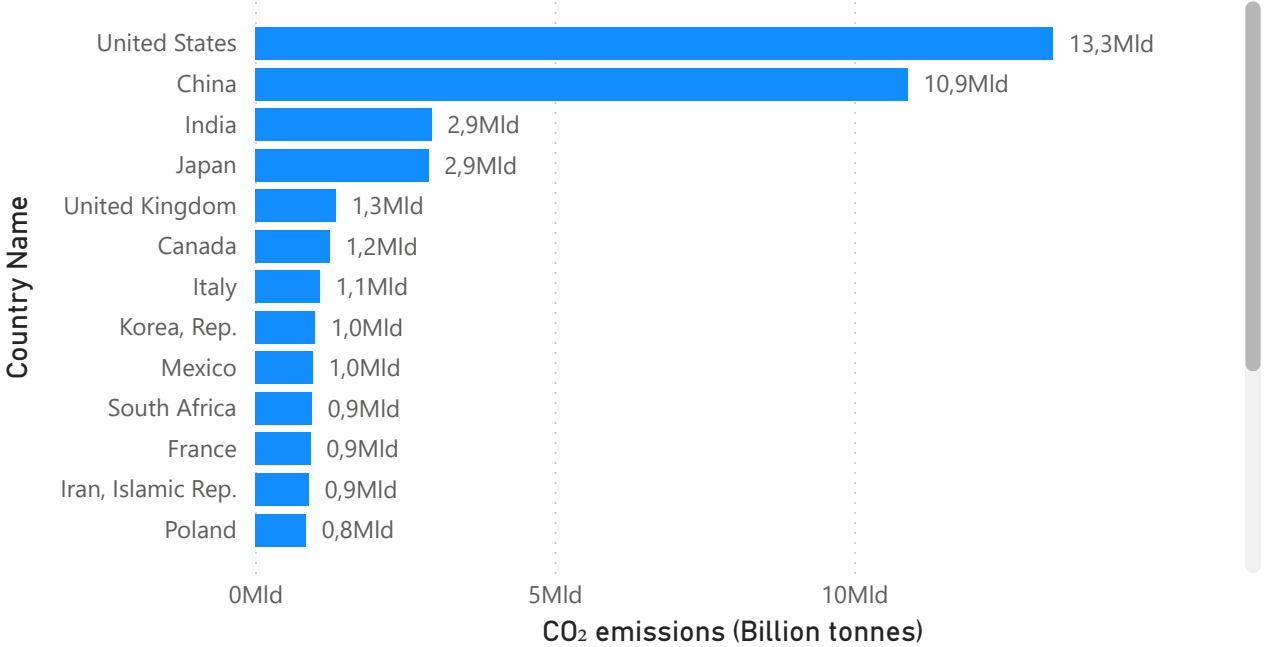

Dataset

World Bank CO₂ emissions dataset
Period analysed: 1986–2011
Global country coverage

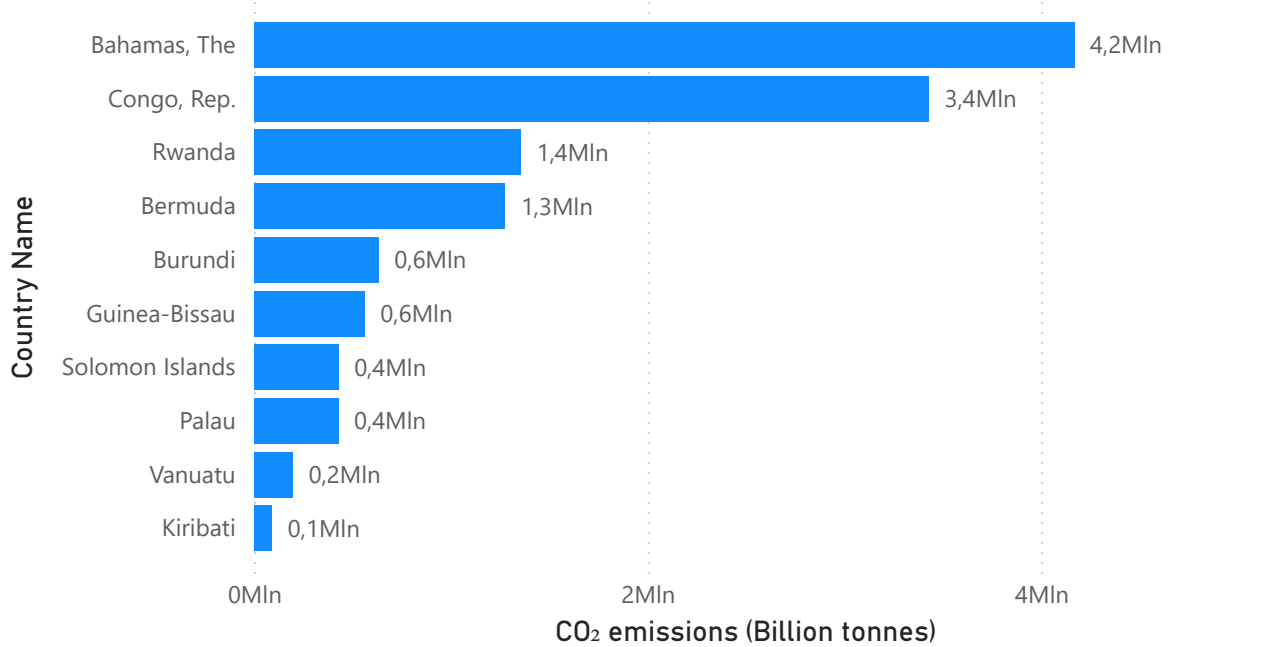

Key questions

- Which countries contribute most to global emissions?
- How have emissions evolved over the last 25 years?
- Which countries show the fastest growth?
- Which countries are stable or reducing emissions?

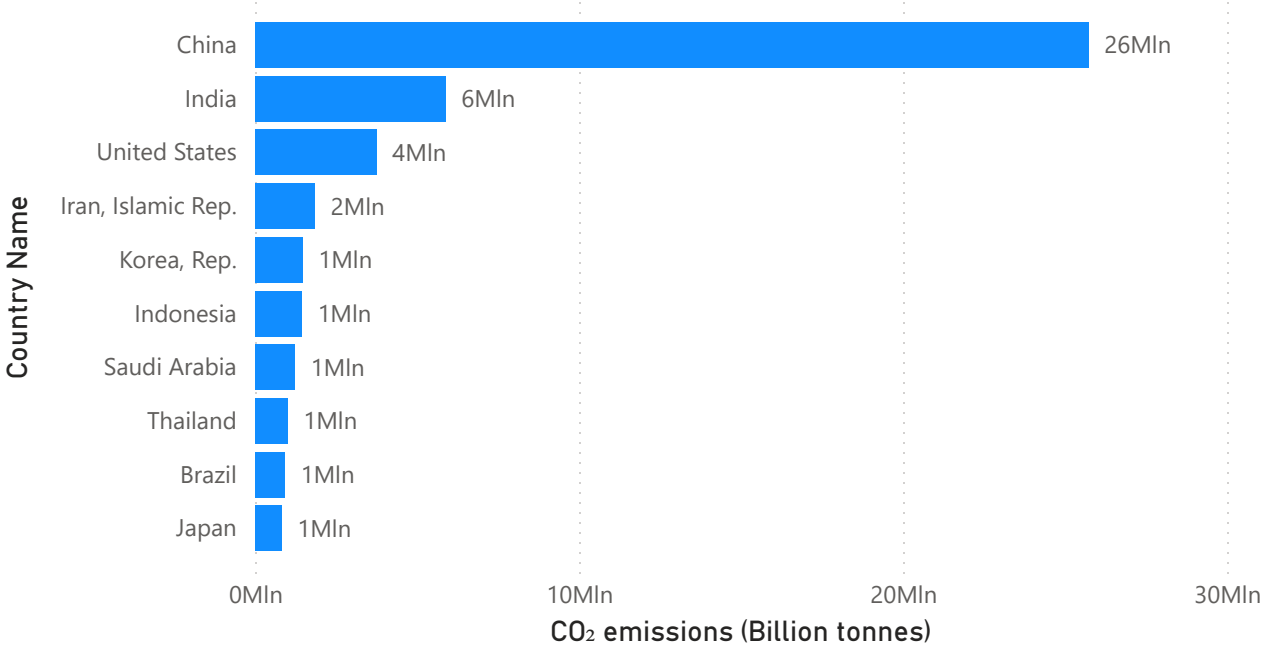

Top 20 countries by cumulative CO₂ emissions (1986–2011)

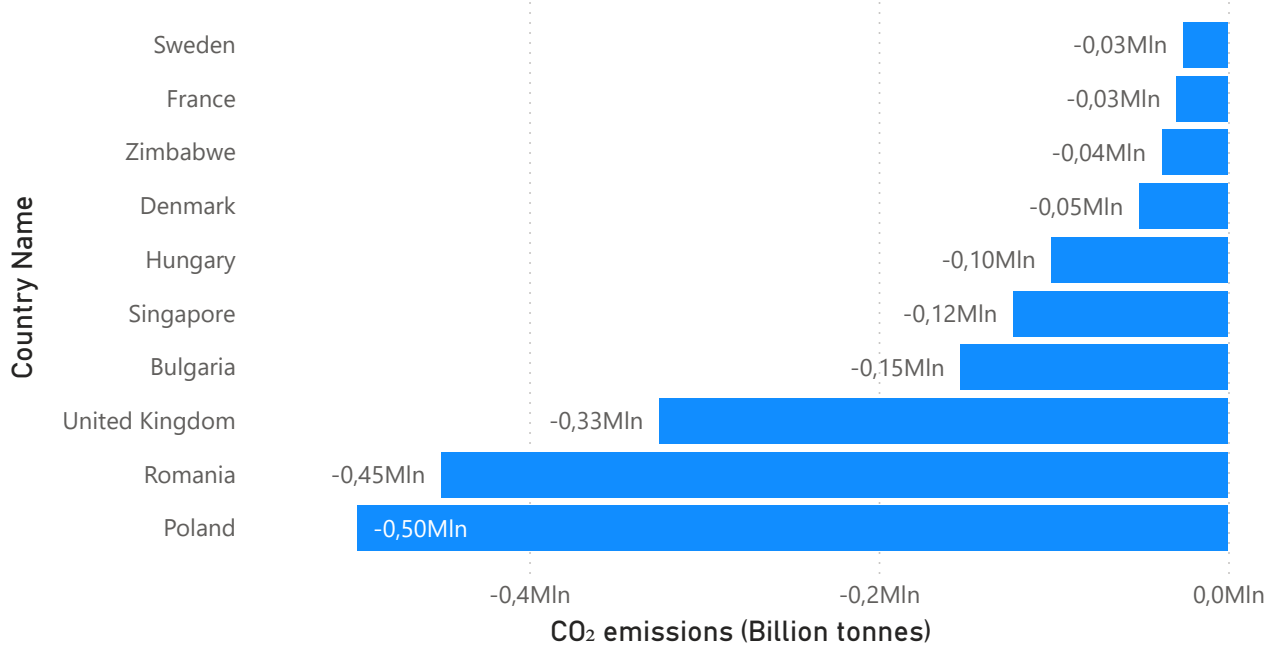

Countries with Stable CO₂ Emissions

Countries with Highest CO₂ Emission Growth

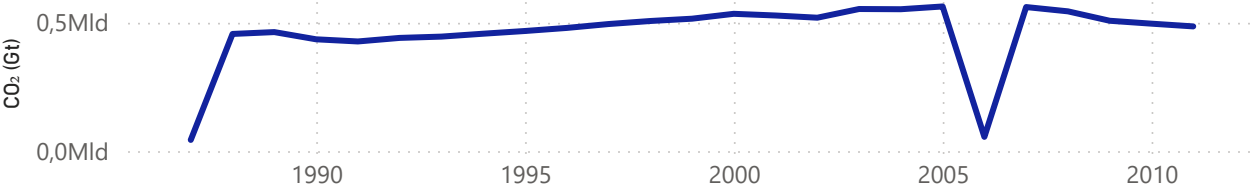

Countries with Largest CO₂ Emission Reduction

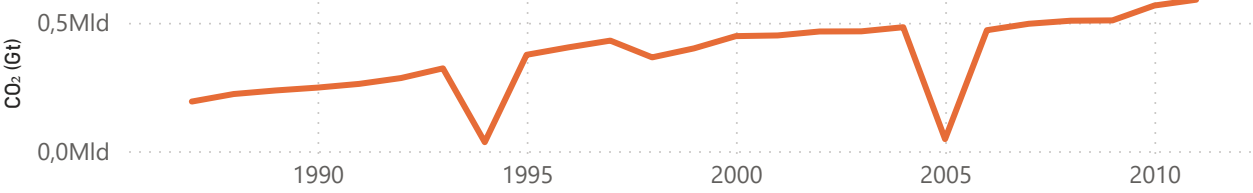

CO₂ emissions trend (1986–2011)

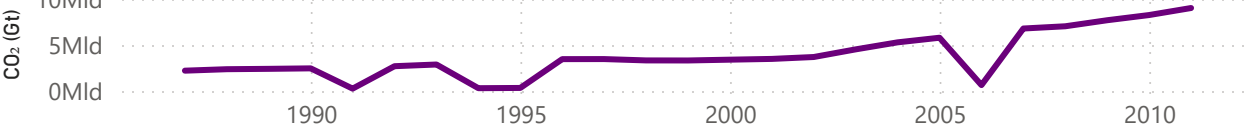

Country Name ● Canada

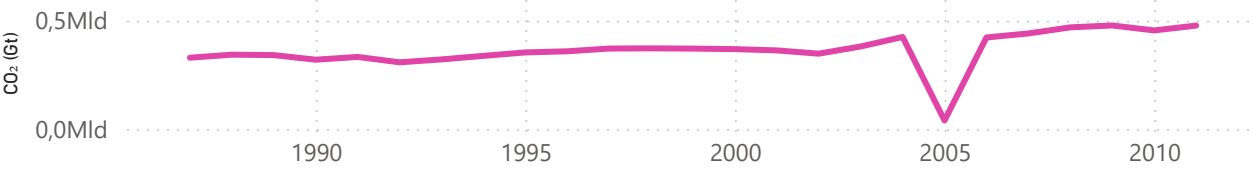

Country Name ● Korea, Rep.

Country Name ● China

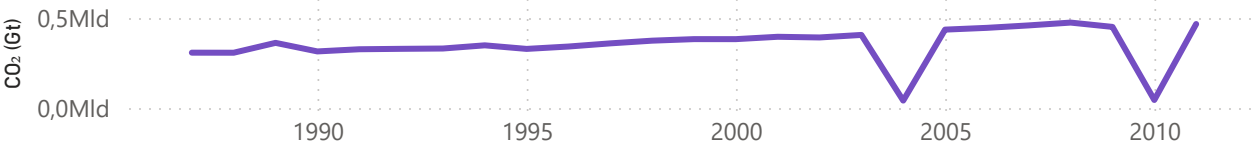

Country Name ● South Africa

Country Name ● India

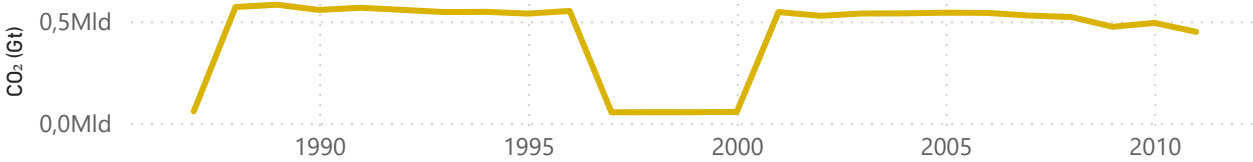

Country Name ● Mexico

Country Name ● Italy

Country Name ● United Kingdom

Country Name ● Japan

Country Name ● United States

Key patterns in global CO₂ emissions (1986–2011)

- Global CO₂ emissions are highly **concentrated** among a small number of countries.
- The **United States and China** are the largest cumulative emitters between 1987 and 2011.
- **China shows the fastest growth** in emissions during the analysed period.
- Some **developed economies** show stable or declining emission trends.
- A few **European countries** display a clear reduction in emissions.

Main conclusions

- Global CO₂ emissions are strongly concentrated among a small number of large economies.
- The **United States and China** dominate cumulative emissions during the analysed period.
- **China** represents the most significant growth in emissions between 1986 and 2011.
- Several **developed economies** show stabilisation or gradual reduction in emissions.
- Emission trends vary significantly between rapidly developing and mature economies.
